Dynamite Token (DYNMT) is an ethereum token that uses the ERC20 based blockchain infrastructure, which is a deflationary cryptocurrency.

WHAT IS ETHEREUM TOKEN?

ERC20 is a protocol standard that defines certain rules and standards for issuing tokens on Ethereum's network.

In 'ERC20', ERC stands for Ethereum Request for Comments and 20 stands for a unique ID number to distinguish this standard from others.

Similar to the fact that we have an HTTP protocol for internet, we have a standard protocol for tokens to be issued on Ethereum ERC20.

To put it in layman terms, if you include certain functions in the token's smart contract, you are ERC20 compliant. If you don't include the mandatory functions, you are not ERC20 compliant.

ERC20

You can see the functionality [here](#).

WHAT IS DYNAMITE TOKEN?

DYNMT is an open source, community-based and focused social experiment. Participation in this experiment does not provide an offer of ordinary shares of any asset, and token holders are not entitled to or promised any dividend / financial reward. The tokens are not designed to create securities under any jurisdiction.

The world's first feature of Dynamite token is that 2% is burned forever with every transfer. The Dynamite Token project is intended as an academic study. All data from this experiment will be presented to the public via reports.

199-line Open Source Code:
<https://github.com/DynamiteToken/Dynamite>

WHAT IS OUR GOAL?

To keep an active project supported by the public and whose results reports can lead to academic studies in this field.

To co-operate with academic staff in this context.

To get the best results from our community and continue to connect our experience to a larger project.

KEY TOKEN INFORMATION

Name	DYNAMITE
Symbol	DYNMT
Decimal	2
Initial supply	900,000 DYNMT
Burn rate	2% (with every transaction)

NO ICO or IEO SALES

Since it was set out as a social project for the benefit of the public with no profit, activities such as ICO or IEO were not carried out.

The other purpose is to prevent the participants from harm. It is known that people have suffered great financial losses due to ICOs made in recent years. For this reason, the ICO process has lost a lot of confidence and IEO processes have started to run.

However, we cannot say that the participants are able to make a profit in the IEO processes. For these reasons we avoided activities such as ICO and IEO, which caused loss of trust. We did not make an ICO to raise funds.

Within the scope of the Dynamite Token project, we intend to give 540,000 tokens to the public at no charge.

There is no commercial purpose to these activities.

Dynamite Token project, which was designed to be inversely proportional to ICO projects, was implemented as a public project with a 2% burn rate.

ROADMAP

Our roadmap plan is open to suggestions from the public. Instead of creating fixed ideas and initiatives that cannot be implemented, the roadmap incorporates ideas provided by our community.

You can review our current roadmap using the link below:

https://dynamitetoken.com/wp-content/uploads/2019/07/Roadmap_dynmt.pdf

The following are key highlights of our roadmap:

Our road map started with free DYNMT given to the public with a 2% burn rate.

The project will be directed and social reports will be produced at set time intervals.

Our holder community is full of prospective bonus campaign plans.

We are aiming to list DYNMT on as many exchanges as possible in order to reach a wider audience.

Updates can be made according to the demands of the community or needs.

FURTHER INFORMATION

Like every project, we want to list DYNMT on the best stock exchanges and turn it into a stable project which we are working extremely hard to achieve.

Dynamite Token is a step ahead of other standard tokens in terms of stability thanks to the community support behind us.

We also have a token that reduces 2% per transfer. We believe that a diminishing number of tokens will always create a balance in terms of falling value.

Decreasing the volume of tokens can create an uplift in stock price thanks to the reduced token velocity,

WHAT IS TOKEN VELOCITY?

Token velocity is the total transaction value divided by the average network value. The average network value is equal to velocity divided by the total transaction value.

Therefore, token velocity is a key factor in determining the long-term value of a token. If the velocity is too high and speculation is constant then it will be difficult to maintain long-term stability.

One solution to this is to slow down velocity. Dynamite Token aims to do this through being a deflationary self-destructive token with a burn rate of 2%.

Deflationary cryptocurrency is still in its infancy, however there is already data available to show how the impact of volume and burn rate on the token price.

The following table provides some examples of this:

TOKEN	LAUNCH	INITIAL VOLUME	BURN RATE	PRICE (ETH)*
DYNMT	JUL 2019	900,000	2%	0.0002
BOMB	FEB 2019	1,000,000	1%	0.03
BLAZE	JUL 2019	3,000,000	3%	0.0001
FUZE	JUN 2019	1000	5%	0.43
NUKE	JUN 2019	1,000,000	2%	0.001

**As at 21 July 2019*

Like any ethereum ERC20 project, Dynamite Token is an open-source publicly released 2% burning ERC20 token.

It is aimed to be the largest value experimental and academic project in the world.
